

Wireless Smoke Alarm (Ionisation)

Wireless Smoke Alarm (Optical)

A choice of ionisation or optical alarms ensures these wireless smoke alarms, with audible sounder, are ideal for all domestic environments.

Powered by a single 9V PP3 alkaline battery, these alarms, with integral radio transmitters are suitable for all situations where Carers' require early warning of an outbreak of fire, whilst providing a powerful audible alarm for the patient.

With automatic battery monitoring, the alarms also send a signal to the Pager and portable SignWave receiver when the battery needs changing.

The units are simply attached to the ceiling with the two screws provided. A test button allows the user to regularly test both the smoke alarm and radio transmitter link in one easy operation.

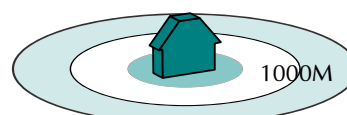

When the alarm activates the Pager or SignWave will flash key 6 to alert the user. Please note that the smoke alarm cannot be set to any other number to avoid confusion.

On our new MkV Care Call Pager (produced after February 2012), the smoke alarm signal will 'lock on' for 15 minutes or until the signal is cancelled to ensure the signal is received.

- Choice of Ionisation or Optical Alarm
- Free Technical Helpline
- Single 9V alkaline battery
- Test button
- Automatic low battery signals
- Operating range in open air approximately 1000m
